Bacteremia and Community-Acquired Pneumonia Caused by *Pantoea stewartii* Subspecies *indologenes*, Australia

Appendix

Appendix Table. *Pantoea* genomes examined in a study of bacteremia and community-acquired pneumonia caused by *Pantoea stewartii* subspecies *indologenes*, Australia.

Strain	Collection date	Origin	GenBank accession
<i>Pantoea stewartii</i>			
<i>P. stewartii</i> subsp. unknown 626	Unknown	Maize, Madras, India	GCA_013277595.1
<i>P. stewartii</i> subsp. unknown CCM 8557	2021	Unknown	GCA_042681965.1
<i>P. stewartii</i> subsp. unknown M009	2013	Waterfall, Malaysia	GCA_000786255.1

Appendix Figure. Midpoint-rooted maximum parsimony phylogenomic analysis of an Australian clinical strain, SCHI0154.S.1 (bolded), against 48 other *Pantoea stewartii* strains (Appendix Table), to determine the closest strain relative/s and potential origin of infection. This tree was reconstructed using 98,746 orthologous, biallelic, genome-wide single-nucleotide polymorphisms identified by SPANDx (6). The patient's isolate was most closely related to PANS 07–14, isolated from a verbena plant in Georgia, USA, in 2007 (8). Notably, the only other Australian strain, C10109_Jinnung (5), was genetically unrelated to SCHI0154.S.1. Branches with <100% bootstrap support are labeled, except within the *P. stewartii* subsp. *stewartii* clade, due to limited resolution among these strains. Consistency index = 0.39.
